NAME
       mkpkg−config − generate a configuration file for pkg−config

SYNOPSIS
       mkpkg-config *options*

DESCRIPTION
       mkpkg-config creates a **pkg-config** metadata (`.pc`) file based upon command line options. It is useful for
       inclusion in scripts.

       It generates the following variables which may be interpolated into the keywords:

       `pkg`
              specifed by the −−**pkg** option.

       `prefix`
              specified by the −−**prefix** option.

       `exec_prefix`
              specified by the −−**exec_prefix** option. It defaults to

                     `exec_prefix=${prefix}`

              If the −−**exec_suffix** option is specified instead of −−**exec_prefix**, it defaults to

                     `exec_prefix=${prefix}/${exec_suffix}`

       `libdir`
              specified by the −−**libdir** option. It defaults to

                     `libdir=${exec_prefix}/lib`

       `includedir`
              specified by the −−**includedir** option. It defaults to

                     `includedir=${prefix}/include`

              or

                     `includedir=${prefix}/include/${pkg}`

              if the −−**pkg** option is specified.

       The following keywords are also generated:

       Name
              This is taken from the −−**name** option.

       Description
              This is taken from the −−**desc** option.

       Version
              This is taken from the −−**pversion** option.

       Requires
              This is taken from the −−**requires** option.

       Conflicts
              This is taken from the −−**conflicts** option.

       Libs
              This is generated from the `libdir` variable and the −−**libs** option. If `libdir` is not *empty*,
              `-L${libdir}` is prepended to *Libs*. If `--libs` is not specified, `-l${pkg}` is added (if −−**pkg** is
              specified).

       Cflags
              This is taken from the −−**cflags** options. If −−**pkg** is specified, `-I${includedir}/${pkg}` is
              prepended.

OPTIONS
General Options
−−output
> Where the configuration file is to be written. It defaults to the standard output stream.

−−version
> Print the version of **mkpkg-config** and exit.

−−help
> Print a short help message and exit.

−−usage
> Print an extended usage message and exit.

Variables
These are described in detail in Description.

−−prefix
> This parameter is required.

−−exec_prefix
−−libdir
−−includedir
−−pkg
−−name
> This parameter is required.

−−desc
> This parameter is required.

−−pversion
> This parameter is required.

−−requires
−−conflicts
−−libs
−−cflags

Modifiers
−−rpath
> This boolean indicates that $-R\${libdir}$ should be added to the *Libs* section.

VERSION
This documents version 1.5.2 of **make-world**.
