

AHELP for CIAO 3.4

acosh

Context: [slangrtl](#)

Jump to: [Description](#) [See Also](#)

Synopsis

Compute the inverse cosh of an number

Syntax

```
y = acosh (x)
```

Description

The acosh function computes the inverse cosh of a number and returns the result as an array. If its argument is an array, the acosh function will be applied to each element and the result returned as an array.
