AHELP for CIAO 3.4   **strcat**   Context: slangrtl

Jump to: Description Example See Also

Synopsis

Concatenate strings

Syntax

```
String_Type strcat (String_Type a_1, ..., String_Type a_N)
```

Description

The strcat function concatenates its N String_Type arguments a_1, ... a_N together and returns the result.

Example

```
    strcat ("Hello", " ", "World");
```
produces the string "Hello World".

This function is equivalent to the binary operation a_1+...+a_N. However, strcat is much faster making it the preferred method to concatenate string.
