

Bugs: prism

Bugs

1. *Prism displays multidimensional vector arrays improperly.*

Workaround:

Use the "array" option in `dmlist` to view the data.

2. *prism does not ignore NaN and NULL values when calculating the the minimum and maximum values of the selected column.*
3. *When editing header values, the old value remains in the display along with the newly entered value. (Mac OS X)*

This is just an issue with displaying the file; when the file is saved, the correct header values are recorded.

4. *There is some inconsistency between prism and dmlist displaying rows from a filtered event list.*

The Chandra X-Ray Center (CXC) is operated for NASA by the Smithsonian Astrophysical Observatory.
