

ObsID: Observation Id

Every *Chandra* observation is assigned an Observation Id (ObsID), which indicates that it is an observation of a specific target for a specific proposal with a specific observational configuration. All data for a given ObsID are always combined into a single set of Level 2 products. Each ObsID contains one or more Observation Intervals.

For more information, see the Multi-part Observations section of the Chandra Standard Data Distribution Contents page.

There are many ways to refer to an observation - Sequence Number, ObsID, etc. Here is a brief overview of how these pieces fit together:

Proposal Number maps to
N x Sequence Numbers maps to
ObsIDs maps to
ObsIDs x

where it is almost always true that $N == M$ (i.e. there is one ObsID per Sequence Number).

The Chandra X-Ray Center (CXC) is operated for NASA by the
Smithsonian Astrophysical Observatory.
