The Galactic X-ray Excess Problem is **Not** Solved

Tony Rodríguez (Caltech) NSF GRFP Fellow | Ford Foundation Fellow

Chandra HRXS Workshop MIT, 3 August 2023

Galactic Ridge Soft X-rays

- Galactic Ridge: I < 40 deg, b < 4 deg
 - Discovered by HEAO-1 in 1982.

Galactic Ridge Hard X-rays

- Galactic Ridge: I < 40 deg, b < 4 deg
 - Discovered by HEAO-1 in 1982.
 - *INTEGRAL* hard X-rays in 2007.

Krivonos 2009

Galactic Ridge Resolved

- Galactic Ridge: I < 40 deg, b < 4 deg
 - Discovered by HEAO-1 in 1982.
 - *INTEGRAL* hard X-rays in 2007.
 - *Chandra* resolved it into discrete sources in 2009.

Revnivstev 2009

Galactic Center Resolved

- Galactic Ridge: I < 40 deg, b < 4 deg
 - Discovered by HEAO-1 in 1982.
 - INTEGRAL hard X-rays in 2007.
 - *Chandra* resolved it into discrete sources in 2009.
- Galactic Center: Inner few pc
 - NuSTAR observed a distinct increase in hard X-rays in the nuclear star cluster (NSC) in 2015.

Perez 2015

Solution: Cataclysmic Variables

• Non-magnetic CVs (64%)

• Intermediate Polars (7%)

• Polars (29%) $kT_{\rm shock, \ bremss} \approx \frac{3}{8} \frac{GM_{\rm WD} \mu m_H}{R_{\rm WD}}$

Solution: Cataclysmic Variables

• Non-magnetic CVs (64%)

• Intermediate Polars (7%)

• Polars (29%)

$$kT_{\rm shock,\ bremss} \approx \frac{3}{8} \frac{GM_{\rm WD} \mu m_H}{R_{\rm WD}}$$

Broadband Fit

 Thermal Bremms: Magnetic CVs with M_{WD} = 0.5M_{Sun}

Spectral Fit

 Assuming all subtypes contribute:

The Problem is Not Solved

Region	Modeling	Dominant CV class	WD mass	Ref.
Galactic Ridge	Continuum	IP	$0.5M\odot$	[2] Krivonos+ 07
Galactic Ridge	Fe Line Emission	Non-magnetic	_	[5] Xu+ 16
Galactic Center	Continuum	IP	$0.9M\odot$	[3] Perez+ 15
Galactic Center	Fe Line Emission	Non-magnetic or IP	$1.0 - 1.25 M \odot$ or $0.6 - 0.8 M \odot$	[6] Xu+ 19

The Problem is Not Solved

The Problem is Not Solved

What Next?

- More X-ray discoveries of magnetic CVs to reveal the diversity of the population.
- 2. More *Chandra* HETG spectra of polars.
