HETGS Simulation

Expected HETGS Counts

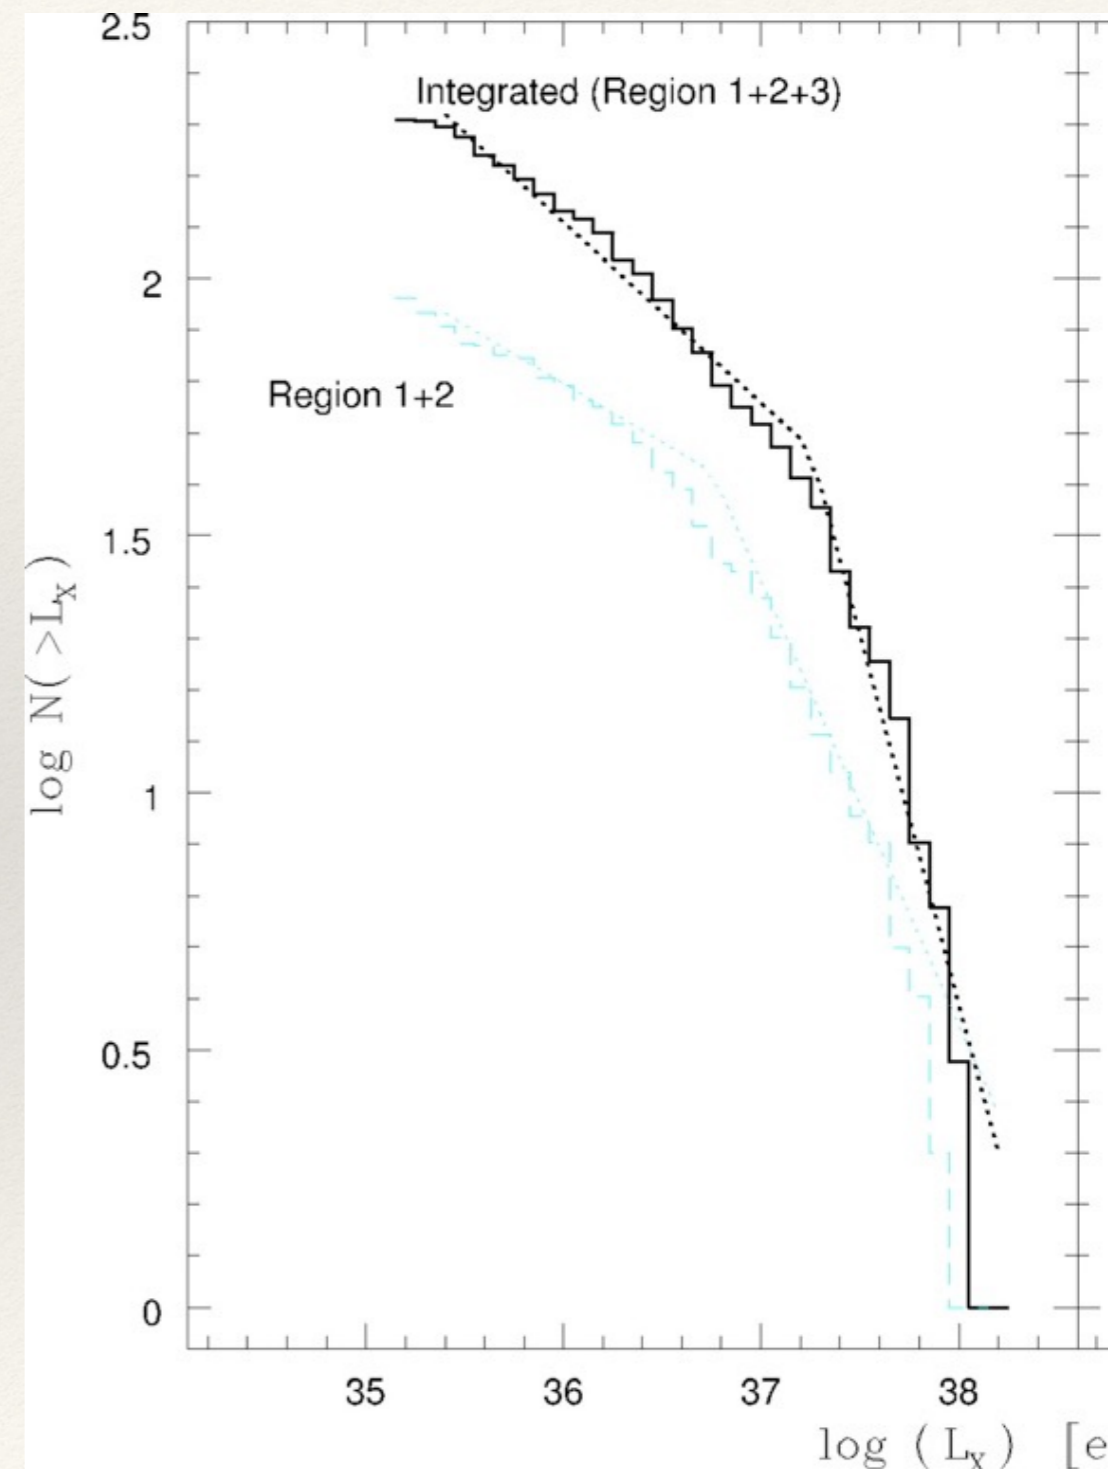

Science Goals

- ❖ Emission Lines from HMXRB winds
- ❖ Emission Lines in SNR
- ❖ ISM Edges in LMXRB
- ❖ Abundances in LMXRBs
- ❖ SuperSoft Sources
- ❖ 1000s of X-ray bursts
- ❖ Oddities: SS 433, Cir X-1

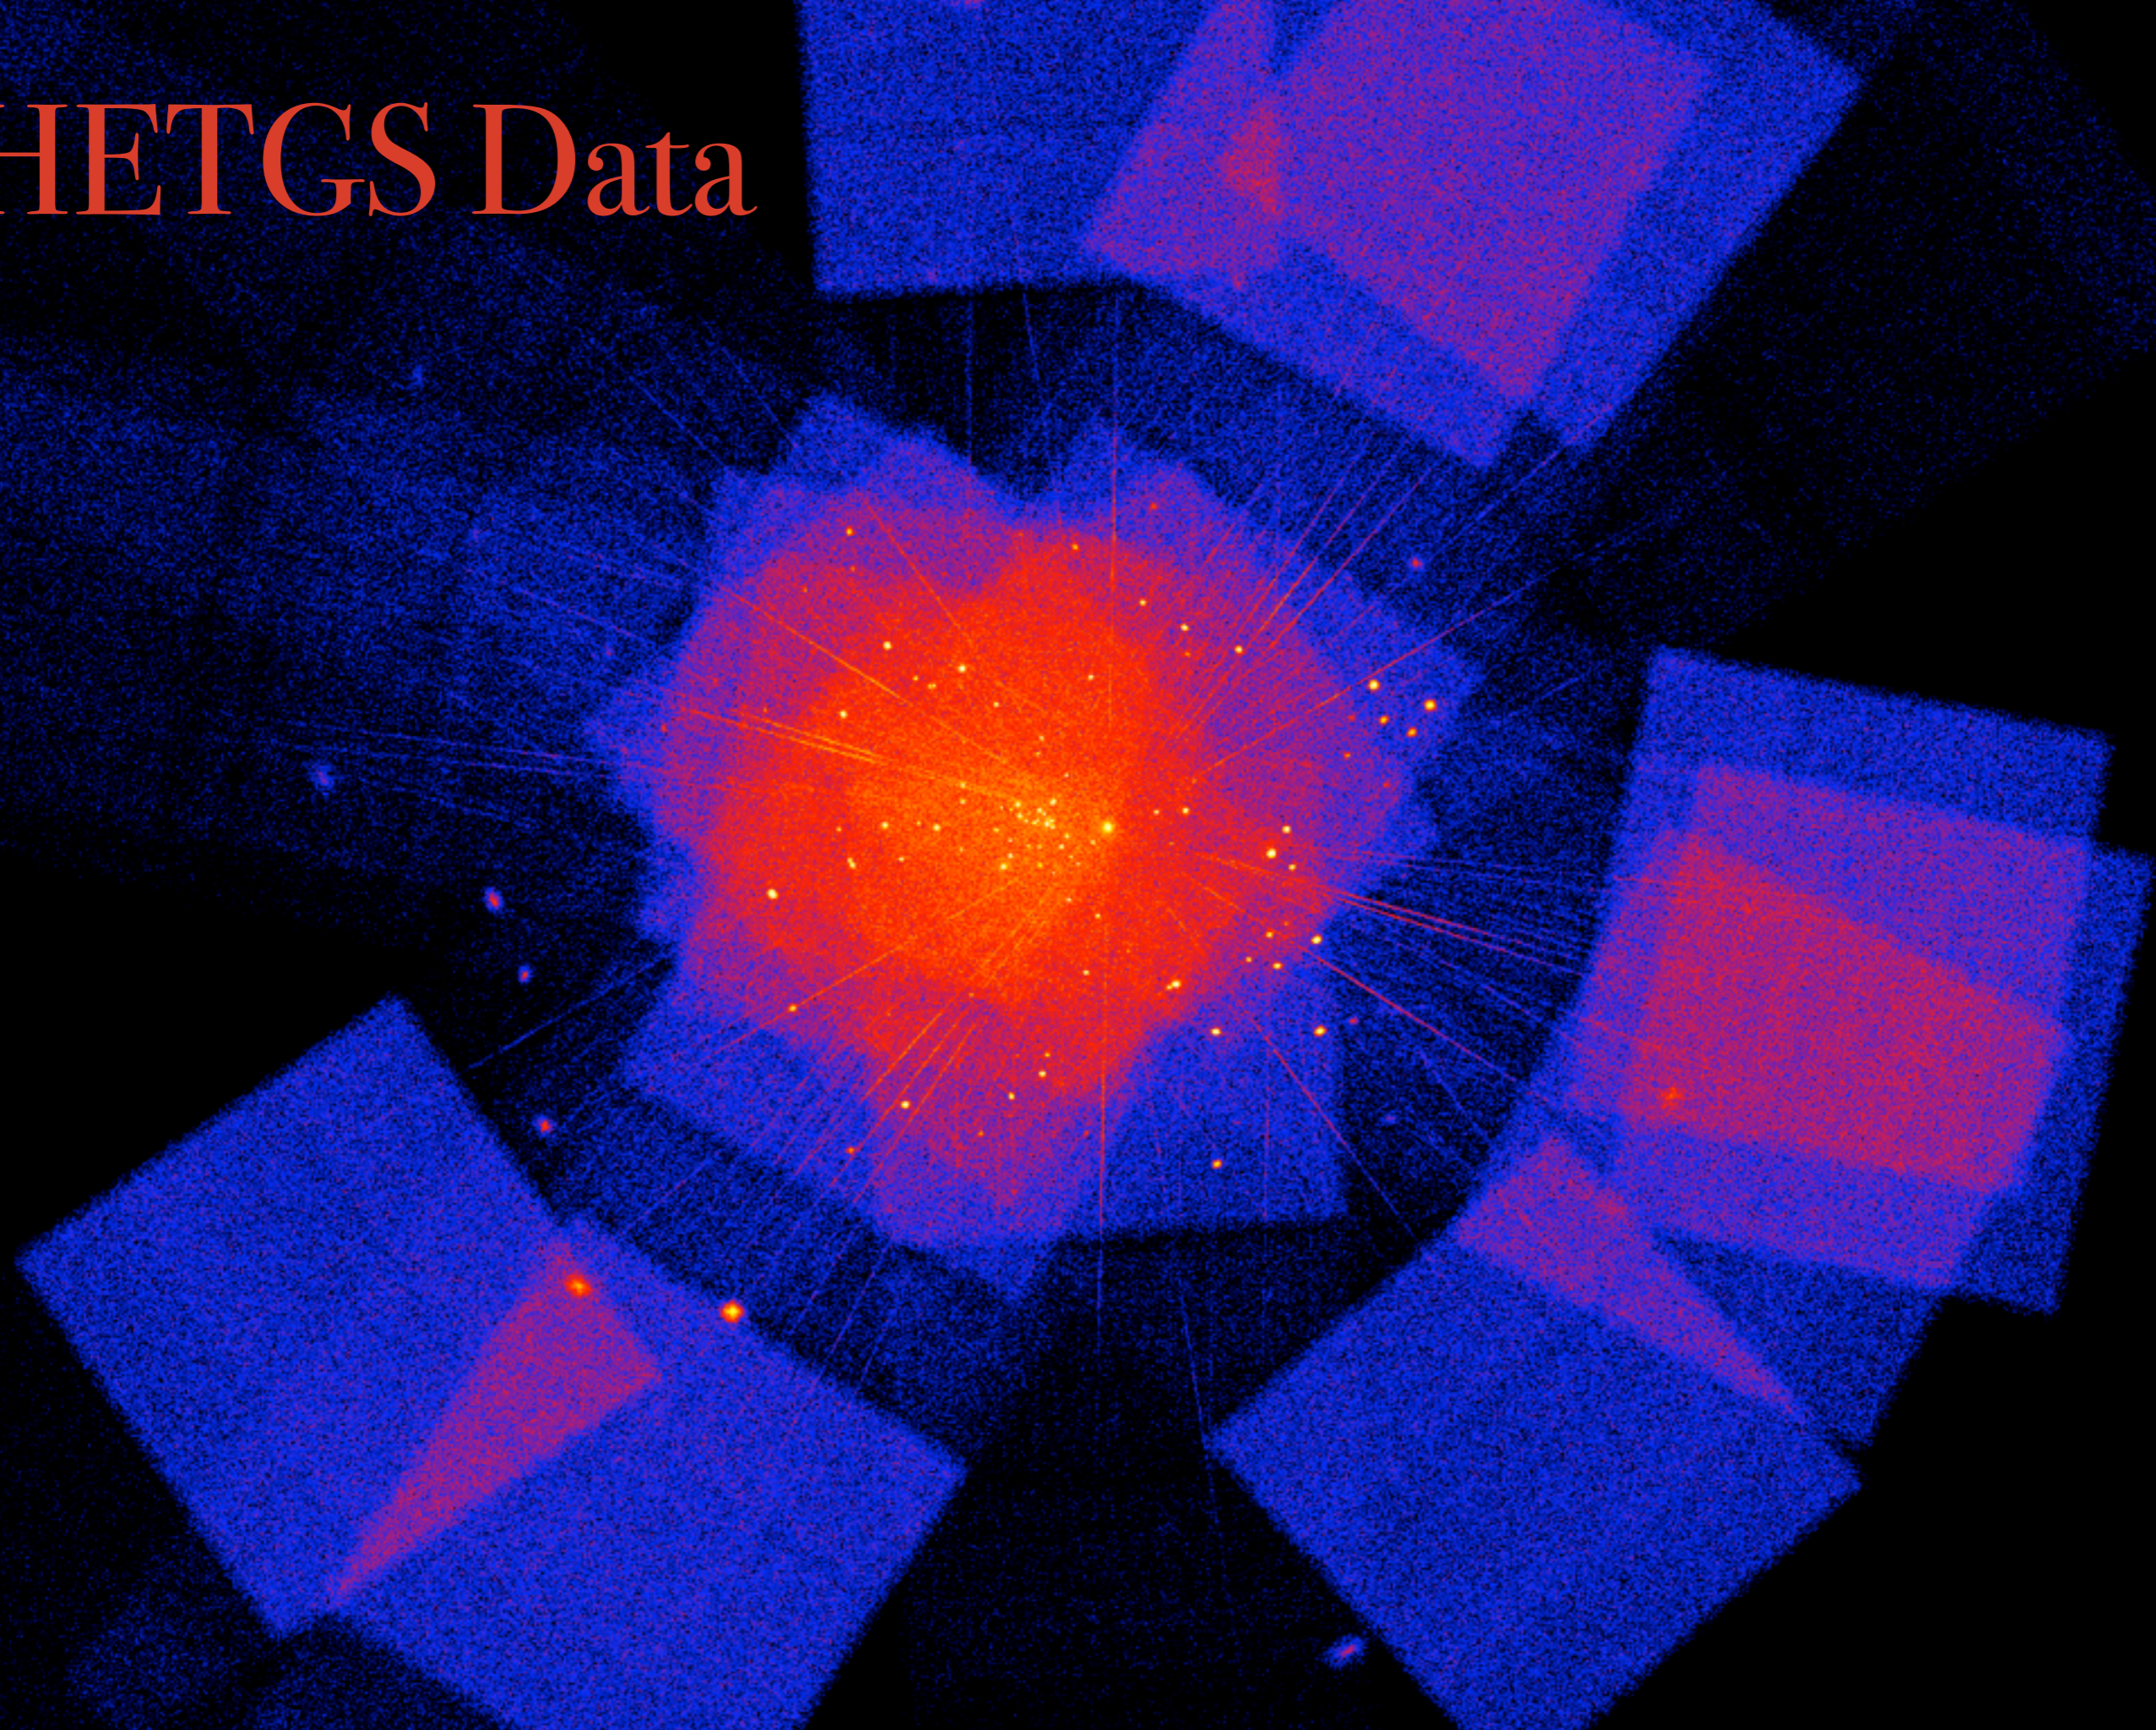

Luminosity Functions

- ❖ Inner Bulge (region 1): $2' \times 2'$
- ❖ Full bulge (Region 2): $8' \times 8'$
- ❖ Bulge LF break: 5×10^{36} erg/s
- ❖ HETGS: 2000 counts per 10^{37} erg/s in 700 ks
- ❖ Brightest SNR at 6×10^{36} erg/s
- ❖ $>20,000$ count for NS with $L = L_{\text{edd}}$

HETGS Data

2.5-3.5 keV

3.5-4.5 keV

Extracting Spectra

- ❖ Easy Part: PHA2, ARF, RMF for 9 obsIDs, 105 sources, 4 arms (HeG, MEG, +1, -1) = ~3800 spectra
- ❖ Hard Part: overlapping spectra of A against B
 - ❖ Biggest issue: 0th order of A overlaps TG of B
 - ❖ See “confusion plots”
 - ❖ make “ignore(obsid / <M,H>EG / <+ / ->1, E1, E2)”
 - ❖ MEG rarely overlaps with MEG (parallel!)
- ❖ HETGS GTO team is prototyping data handling

./15277/S_002 MEG

./15277/S_002 HEG

./15277/S_002/evt2 MEG

./15277/S_002/evt2 HEG

./15276/S_039 MEG

./15276/S_039 HEG

./15276/S_039/evt2 MEG

./15276/S_039/evt2 HEG

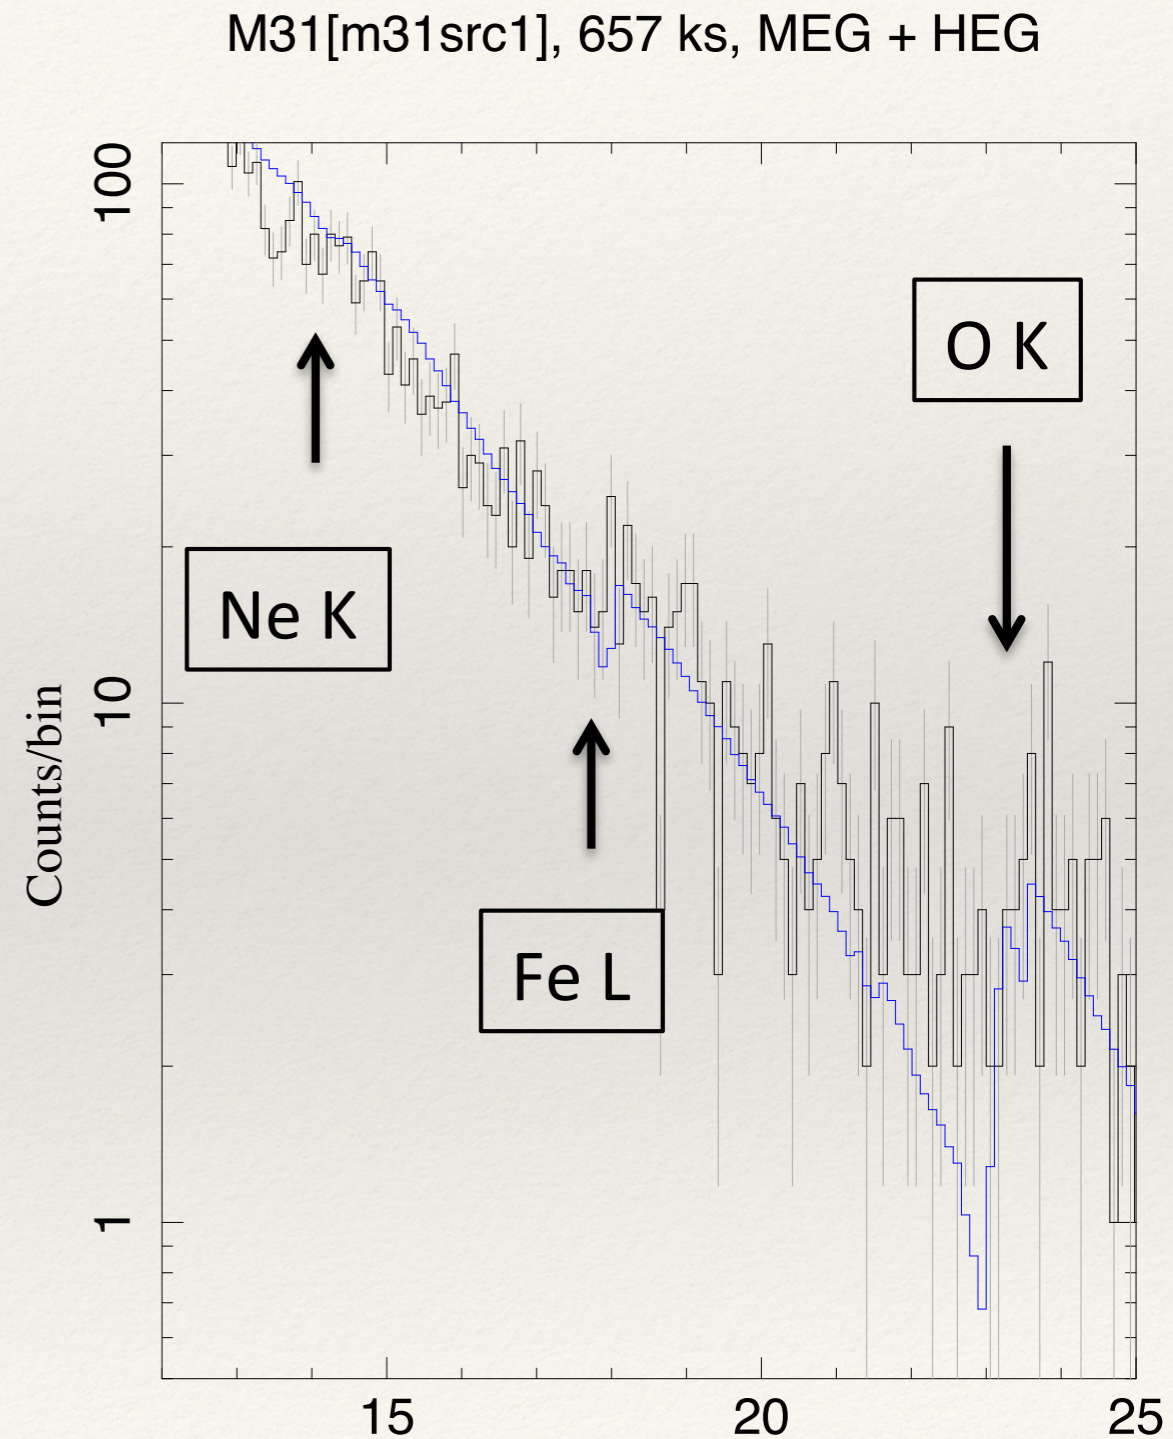

Brightest Source

- ❖ r2-26 (Kong+ '02 catalog)
- ❖ 0.12 cps (MEG+HEG) --> 8,300 counts in 1st obsID
- ❖ PL fit: $\Gamma = 1.6$, $N_H = 1.4e21$

ISM Probes

- ❖ Brightest Source in M31
 - ❖ 21 cm: $N_{\text{H},21} = 1.6$
 - ❖ XMM: $N_{\text{H},21} = 2.8 \pm 1.2$
 - ❖ HETGS: $N_{\text{H},21} = 3.2 \pm 1.4$
- ❖ In progress:
 - ❖ N_{H} for other XRBs
 - ❖ Compare Fe L (dust!) to O-K
 - ❖ Test against MW

Many More Sources

M31[m31src3], 657 ks, MEG + HEG

M31[m31src19], 657 ks, MEG + HEG

Future of Chandra and You

- ❖ How can YOU get involved (before Athena, Surveyor)?
 - ❖ AGN?, then M 31* spectra, variability
 - ❖ XRBs?, then
 - ❖ Transient spectroscopy w/o pileup
 - ❖ All bulge XRBs observed as a population
 - ❖ ISM?: Edges give elemental abundances, spatial variation
 - ❖ SNRs? (better line SNRs!)
 - ❖ Examine soft lines and ionization states
 - ❖ Add pointing to arm of M 31!
 - ❖ Challenging analysis? (timing, diffuse emission, isis → python)
- ❖ Exposure time goal: consider 10% of Chandra's (remaining) lifetime!
 - ❖ >3 Ms for M 31? 5 Ms for M33, 10 Ms on NGC 300, others?
- ❖ Get ready for Surveyor!
 - ❖ (PS: Ask me about the REDSoX Polarimeter!)
