## str\_uncomment\_string

Context: [slangrtl](#)

*Jump to:* [Description](#) [Example](#) [See Also](#)

---

## Synopsis

Remove comments from a string

## Syntax

```
String_Type str_uncomment_string(String_Type s, String_Type beg,
String_Type end)
```

## Description

This function may be used to remove comments from a string *s*. The parameters, *beg* and *end*, are strings of equal length whose corresponding characters specify the begin and end comment characters, respectively. It returns the uncommented string.

## Example

The expression

```
str_uncomment_string ("Hello (testing) 'example' World", "'(', ')')")
```

returns the string "Hello World".

This routine does not handle multicharacter comment delimiters and it assumes that comments are not nested.
