

AHELP for CIAO 3.4

strchopr

Context: [slangrtl](#)

Jump to: [Description](#) [See Also](#)

Synopsis

Chop or split a string into substrings.

Syntax

```
String_Type[] strchopr (String_Type str, String_Type delim, String_Type  
quote)
```

Description

This routine performs exactly the same function as `strchop` except that it returns the substrings in the reverse order. See the documentation for `strchop` for more information.
