Obtain Grating Spectra from LETG/HRC-I Data

CIAO 3.4 Science Threads

Overview

Last Update: 1 Dec 2006 – updated for CIAO 3.4: change to wording of `tgdetect/dmcopy` warning

Synopsis:

Generate a new PHA2 spectrum file for any LETG/HRC-I grating observation.

Purpose:

To ensure that consistent calibration is used throughout the analysis.

Read this thread if:

you are working with an LETG/HRC-I dataset.

Related Links:

- [Analysis Guide for Chandra High Resolution Spectroscopy](#): an in-depth discussion of grating analysis.

Proceed to the [HTML](#) or [hardcopy \(PDF: \[A4\]\(#\) / \[letter\]\(#\)\)](#) version of the thread.

Data Preparation

This analysis thread starts with the level 1 event file. Before beginning, users may wish to reprocess the data to create a new event file with the most recent calibration applied. Instructions on how to reprocess your data are available in the [HRC Data Preparation Analysis Guide](#).

Get Started

Sample ObsID used: 1801 (LETG/HRC-I, PKS2155-304)

File types needed: `evt1`; `flt1`; `asol1`

In this thread, we assume that all relevant files are in the same working directory.

Generate A New Level=1.5 Event File

1. Get position of zero-order image (tgdetect)

To find the zero-order location, the tool `tgdetect` is run:

```
unix% punlearn tgdetect
unix% pset tgdetect infile=hrcf01801_000N003_evt1.fits
unix% pset tgdetect outfile=hrc_1801_evt1_src1a.fits
unix% tgdetect
Input L1 event file (hrcf01801_000N003_evt1.fits):
Input source position(s) file from previous OBI or NONE (NONE):
Output source position(s) file name (hrc_1801_evt1_src1a.fits):
# DMCCOPY (CIAO 3.4): Bad data type in filter string formatting
```

The warning may be ignored; it is due to a minor bug in the Data Model and does not affect the output of `tgdetect`.

The contents of the parameter file may be checked using `plist tgdetect`.

The source list may be viewed over the event file using `ds9`:

```
unix% ds9 hrcf01801_000N003_evt1.fits &
```

Overlay the source list: Region-> Load Regions-> hrc_1801_evt1_src1a.fits[SRCLIST].

If the zero order of the source is outside of the default search area (e.g. far from the aimpoint), `tgdetect` will not find it. ***If this problem affects your data, it will be obvious when the source list is displayed on the event file.*** In this case, run the [Correcting a Misplaced Zero-order Source Position thread](#) to identify the correct source position.

2. Get region mask (tg_create_mask)

The location of the spectrum needs to be found next, via the tool `tg_create_mask`, which creates a region file that will be used to mask the image:

```
unix% punlearn tg_create_mask
unix% pset tg_create_mask infile=hrcf01801_000N003_evt1.fits
unix% pset tg_create_mask outfile=hrc_1801_evt1_L1a.fits
unix% pset tg_create_mask input_pos_tab=hrc_1801_evt1_src1a.fits
unix% tg_create_mask
Input event file or stack (hrcf01801_000N003_evt1.fits):
Output region file or stack (hrc_1801_evt1_L1a.fits):
Input table with zero order positions or stack (hrc_1801_evt1_src1a.fits):
Observed grating type (header_value|HETG|HEG|MEG|LETG) (HETG|HEG|MEG|LETG|header_value|HEADER_VALUE) (h
```

The contents of the parameter file may be checked using `plist tg_create_mask`.

3. Run tg_resolve_events

The tool `tg_resolve_events` is now used to assign grating events to spectral orders:

```
unix% punlearn tg_resolve_events
unix% pset tg_resolve_events infile=hrcf01801_000N003_evt1.fits
unix% pset tg_resolve_events outfile=hrc_1801_evt1a.fits
unix% pset tg_resolve_events regionfile=hrc_1801_evt1_L1a.fits
```

```
unix% pset tg_resolve_events acaofffile=pcadf082337011N002_asol1.fits
unix% pset tg_resolve_events eventdef=")stdlev1_HRC"
unix% pset tg_resolve_events osipfile=none
unix% tg_resolve_events
Input event file or stack (hrcf01801_000N003_evt1.fits):
Input region file or stack (hrc_1801_evt1_L1a.fits):
Output event file or stack (hrc_1801_evt1a.fits):
Input aspect offset file (pcadf082337011N002_asol1.fits):
```

It is important to note several things here:

- In some cases there will be more than one asol1.fits file for an observation. **All** the files must be input to the `acaofffile` parameter **in chronological order** (the time is in the filename, so "ls" lists them in order), either as a comma-separated list or as a stack (see [stack](#) for more information).
- The unusual syntax of the `eventdef` parameter; the tool will not access the predefined string if the leading ")" is missing.

The contents of the parameter file may be checked using `plist tg_resolve_events`.

The created region file, which has been appended to the event file as a block, may be viewed over the event file using ds9:

```
unix% ds9 hrc_1801_evt1a.fits &
```

Overlay the region file that was created by `tg_create_mask` (Region-> Load Regions-> hrc_1801_evt1a.fits[REGION]) and you should see something like [Figure 1](#) .

Generate a New Level=2 Event File

1. Filter on status (dmcopy)

Next we apply the status filter that is specific to HRC-I observations; a value of 0 demands that the bit be flagged as "good", a value of x indicates that either status (0/1) is acceptable:

```
unix% punlearn dmcopy
unix% dmcopy "hrc_1801_evt1a.fits[status=xxxxxx00xxxx0xxx0000x000x0000000]" \
hrc_1801_flt1_evt1a.fits opt=all
```

2. Apply GTI filter (dmcopy)

Finally, the Good Time Intervals (GTIs) supplied by the pipeline are applied:

```
unix% punlearn dmcopy
unix% dmcopy \
"hrc_1801_flt1_evt1a.fits[EVENTS][@hrcf01801_000N003_std_flt1.fits]" \
hrc_1801_evt2.fits opt=all
```

Be sure to include the `@symbol` in the [filter expression](#); the command will not be executed properly if it is omitted.

Extract a Grating Spectrum (tgextract)

The CIAO tool `tgextract` produces a PHA2 spectrum file from the level=2 data file:

```
unix% punlearn tgextract
unix% pset tgextract infile=hrc_1801_evt2.fits
unix% pset tgextract outfile=hrc_1801 pha2.fits
unix% tgextract
Input event file (output event file from L1.5 processing) (hrc_1801_evt2.fits):
If typeII, enter full output file name or '.'; if typeI, enter output rootname (hrc_1801 pha2.fits):
Input ancillary response file name (none):
Input redistribution file name (none):
Source ID's to process: 'all', comma list, @file (all):
Grating parts to process: HETG, HEG, MEG, LETG, header_value (HETG|HEG|MEG|LETG|header_value) (header_v
Grating diffraction orders to process: 'default', comma list, range list, @file (default):
Output file type: typeI (single spectrum) or typeII (multiple spectra) (pha_typeI|pha_typeII) (pha_typeI
```

The contents of the parameter file may be checked using `plist tgextract`.

Summary

This thread is now complete; the PHA2 grating spectrum file is named `hrc_1801 pha2.fits`. You should now proceed to the [Create Grating RMFs for HRC Observations](#) thread.

# -----
# The parameters below are to be set ONLY if the user wants to use their
# own grating mask sizes instead of having the masks automatically generated.
# Only ONE input file, with up to 10 soures, can be processed using the user
# params. @ lists of multiple files can only be done with automated mask
# processing, or by running each file individually with hand set mask sizes.
# To start, you MUST set the following parameters:
#
# > pset tg_create_mask use_user_pars=yes last_source_toread=[letter A -> J]
#
# The parameter last_source_toread should be set to the last source letter
# for which you will enter parameters. If you want to input 2 sources
# (regardless of their source id's), the last_source_toread=B. Sections
# A -> J are for (upto) 10 user specified sources. In each sections,
# each source must have an ID, a zero order center position specified,
# as well as the grating mask width(s). An example with 2 HETG sources,
# with src_id's 6 and 3:
#
# > pset tg_create_mask use_user_pars=yes last_source_toread=B
# > pset tg_create_mask sA_id=6 sA_zero_x=4762.34 sA_zero_y=2344.29
# > pset tg_create_mask sA_zero_rad=35 sA_width_heg=25 sA_width_meg=28
# > pset tg_create_mask sB_id=3 sB_zero_x=4063.54 sB_zero_y=6346.62
# > pset tg_create_mask sB_zero_rad=45 sB_width_heg=50 sB_width_meg=75
# (units are all in sky pixels)
#
# NOTE: for Continuous Clocking data (CC mode), the HETG mask does not
# require the s#_width_heg, since the meg mask will encompass the entire
# data set. HEG event processing in CC mode is done using the next
# tool tg_resolve_events.
# -----
(use_user_pars = no) Use the user defined mask parameters below: yes or no?
(last_source_toread = A) Last source name to be read; character A->J.
# -----
# Source A parameters
# -----
(sA_id = 1) Source A - source id number
(sA_zero_rad = ) Source A - radius of zero order mask
(sA_width_heg = ) Source A - width of heg mask in sky pixels
(sA_width_meg = ) Source A - width of meg mask in sky pixels
(sA_width_leg = ) Source A - width of leg mask in sky pixels
# -----
# Source B parameters
# -----

#   "-5, -1, 1, 3"
# - a range list sets the min and max of the orders to process;
# all the orders in between, will be processed, ie:
#   "-1..5" will do orders from -1 to +5th order
# a range list can be mixed with comma separated list
# - @file is a pointer to an ascii file which contains a comma
# separated list and/or range list of the orders to process
#
tg_order_list = default      Grating diffraction orders to process: 'default', comma list, range 1
ancrfile = none             Input ancillary response file name
respfile = none            Input redistribution file name
outfile_type = pha_typeII   Output file type: typeI (single spectrum) or typeII (multiple spectra)
(inregion_file = none)     Input region file.
(backfile = none)         Input background file name
(rowid = )                If rowid column is to be filled in, enter name here
(bin_units = angstrom)    Bin units (for bin parameters below): angstrom, eV, keV
(min_bin_leg = compute)   Minimum dispersion coordinate for LEG, or 'compute'
(max_bin_leg = compute)   Maximum dispersion coordinate for LEG, or 'compute'
(bin_size_leg = compute)  Bin size for binning LEG spectra, or 'compute'
(num_bins_leg = compute)  Number of bins for the output LEG spectra, 'compute'
(min_bin_meg = compute)   Minimum dispersion coordinate for MEG, or 'compute'
(max_bin_meg = compute)   Maximum dispersion coordinate for MEG, or 'compute'
(bin_size_meg = compute)  Bin size for binning MEG spectra, or 'compute'
(num_bins_meg = compute)  Number of bins for the output MEG spectra, or 'compute'
(min_bin_heg = compute)   Minimum dispersion coordinate for HEG, or 'compute'
(max_bin_heg = compute)   Maximum dispersion coordinate for HEG, or 'compute'
(bin_size_heg = compute)  Bin size for binning HEG spectra, or 'compute'
(num_bins_heg = compute)  Number of bins for the output HEG spectra, 'compute'
(min_tg_d = default)      Minimum tg_d range to include in histogram, or use 'default'
(max_tg_d = default)      Maximum tg_d range to include in histogram, or use 'default'
(extract_background = yes) Extract the local background spectrum?
(min_upbkg_tg_d = default) Minimum value of tg_d for the background up spectrum.
(max_upbkg_tg_d = default) Maximum value of tg_d for the background up spectrum.
(min_downbkg_tg_d = default) Minimum value of tg_d for the background down spectrum.
(max_downbkg_tg_d = default) Maximum value of tg_d for the background down spectrum.
(geompar = geom)         Parameter file for Pixlib Geometry files
(clobber = no)           OK to overwrite existing output file(s)?
(verbose = 0)             Verbosity level (0 = no display)
(mode = ql)
```

History

16 Dec 2004 updated for CIAO 3.2: minor changes to parameter files

05 Dec 2005 updated for CIAO 3.3: output filenames include ObsID; parameter file change (kernel parameter removed from all "tg" tools)

Obtain Grating Spectra from LETG/HRC-I Data – CIAO 3.4

05 Jan 2006 created Data Preparation section

01 Dec 2006 updated for CIAO 3.4: change to wording of `tgdetect/dmcopy` warning
